

Machine-Level Programming II: Arithmetic & Control

Lecture 3 - 2015
Mads Chr. Olesen

Credits to Alexandre David (AAU),
Randy Bryant & Dave O'Hallaron (CMU)

Today

- **Complete addressing mode, address computation (leal)**
- Arithmetic operations
- Control: Condition codes
- Conditional branches
- While loops

Complete Memory Addressing Modes

■ Most General Form

■ $D(Rb, Ri, S) \text{ Mem}[Reg[Rb] + S * Reg[Ri] + D]$

- D: Constant “displacement” 1, 2, or 4 bytes
- Rb: Base register: Any of 8 integer registers
- Ri: Index register: Any, except for %esp
 - Unlikely you’d use %ebp, either
- S: Scale: 1, 2, 4, or 8 (**why these numbers?**)

■ Special Cases

■ $(Rb, Ri) \text{ Mem}[Reg[Rb] + Reg[Ri]]$

■ $D(Rb, Ri) \text{ Mem}[Reg[Rb] + Reg[Ri] + D]$

■ $(Rb, Ri, S) \text{ Mem}[Reg[Rb] + S * Reg[Ri]]$

Address Computation Examples

%edx	0xf000
%ecx	0x0100

Expression	Address Computation	Address
0x8(%edx)		
(%edx,%ecx)		
(%edx,%ecx,4)		
0x80(,%edx,2)		

Address Computation Examples

%edx	0xf000
%ecx	0x0100

Expression	Address Computation	Address
0x8(%edx)	$0xf000 + 0x8$	0xf008
(%edx,%ecx)	$0xf000 + 0x100$	0xf100
(%edx,%ecx,4)	$0xf000 + 4 * 0x100$	0xf400
0x80(,%edx,2)	$2 * 0xf000 + 0x80$	0x1e080

Address Computation Instruction

■ `leal Src, Dest`

- Src is address mode expression
- Set Dest to address denoted by expression

■ Uses

- Computing addresses without a memory reference
 - E.g., translation of `p = &x[i];`
- Computing arithmetic expressions of the form $x + k*y$
 - $k = 1, 2, 4, \text{ or } 8$

■ Example

```
int mul12(int x)
{
    return x*12;
}
```

Converted to ASM by compiler:

```
leal  (%eax,%eax,2), %eax    ;t <- x+x*2
sall  $2, %eax               ;return t<<2
```

Today

- Complete addressing mode, address computation (leal)
- **Arithmetic operations**
- Control: Condition codes
- Conditional branches
- While loops

Some Arithmetic Operations

■ Two Operand Instructions:

Format

Computation

addl Src, Dest $\text{Dest} = \text{Dest} + \text{Src}$

subl Src, Dest $\text{Dest} = \text{Dest} - \text{Src}$

imull Src, Dest $\text{Dest} = \text{Dest} * \text{Src}$

sall Src, Dest $\text{Dest} = \text{Dest} \ll \text{Src}$ Also called **shll**

sarl Src, Dest $\text{Dest} = \text{Dest} \gg \text{Src}$ Arithmetic

shrl Src, Dest $\text{Dest} = \text{Dest} \gg \text{Src}$ Logical

xorl Src, Dest $\text{Dest} = \text{Dest} \wedge \text{Src}$

andl Src, Dest $\text{Dest} = \text{Dest} \& \text{Src}$

orl Src, Dest $\text{Dest} = \text{Dest} | \text{Src}$

■ Watch out for argument order!

■ No distinction between signed and unsigned int (why?)

Some Arithmetic Operations

■ One Operand Instructions

`incl` Dest $\text{Dest} = \text{Dest} + 1$

`decl` Dest $\text{Dest} = \text{Dest} - 1$

`negl` Dest $\text{Dest} = -\text{Dest}$

`notl` Dest $\text{Dest} = \sim\text{Dest}$

■ See book for more instructions

Arithmetic Expression Example

```
int arith(int x, int y, int z)
{
    int t1 = x+y;
    int t2 = z+t1;
    int t3 = x+4;
    int t4 = y * 48;
    int t5 = t3 + t4;
    int rval = t2 * t5;
    return rval;
}
```

arith:

pushl	%ebp	} Set Up
movl	%esp, %ebp	
movl	8(%ebp), %ecx	} Body
movl	12(%ebp), %edx	
leal	(%edx,%edx,2), %eax	
sall	\$4, %eax	
leal	4(%ecx,%eax), %eax	
addl	%ecx, %edx	
addl	16(%ebp), %edx	} Finish
imull	%edx, %eax	
popl	%ebp	
ret		

Understanding arith

```
int arith(int x, int y, int z)
{
    int t1 = x+y;
    int t2 = z+t1;
    int t3 = x+4;
    int t4 = y * 48;
    int t5 = t3 + t4;
    int rval = t2 * t5;
    return rval;
}
```

```
movl    8(%ebp), %ecx
movl    12(%ebp), %edx
leal    (%edx,%edx,2), %eax
sall    $4, %eax
leal    4(%ecx,%eax), %eax
addl    %ecx, %edx
addl    16(%ebp), %edx
imull   %edx, %eax
```

Understanding arith

```
int arith(int x, int y, int z)
{
    int t1 = x+y;
    int t2 = z+t1;
    int t3 = x+4;
    int t4 = y * 48;
    int t5 = t3 + t4;
    int rval = t2 * t5;
    return rval;
}
```

```
movl    8(%ebp), %ecx      # ecx = x
movl    12(%ebp), %edx     # edx = y
leal    (%edx,%edx,2), %eax # eax = y*3
sall    $4, %eax          # eax *= 16 (t4)
leal    4(%ecx,%eax), %eax # eax = t4 +x+4 (t5)
addl    %ecx, %edx        # edx = x+y (t1)
addl    16(%ebp), %edx    # edx += z (t2)
imull   %edx, %eax        # eax = t2 * t5 (rval)
```

Observations about arith

```
int arith(int x, int y, int z)
{
    int t1 = x+y;
    int t2 = z+t1;
    int t3 = x+4;
    int t4 = y * 48;
    int t5 = t3 + t4;
    int rval = t2 * t5;
    return rval;
}
```

- Instructions in different order from C code
- Some expressions require multiple instructions
- Some instructions cover multiple expressions
- Get exact same code when compile:
 - $(x+y+z) * (x+4+48*y)$

movl	8(%ebp), %ecx	# ecx = x
movl	12(%ebp), %edx	# edx = y
leal	(%edx,%edx,2), %eax	# eax = y*3
sall	\$4, %eax	# eax *= 16 (t4)
leal	4(%ecx,%eax), %eax	# eax = t4 +x+4 (t5)
addl	%ecx, %edx	# edx = x+y (t1)
addl	16(%ebp), %edx	# edx += z (t2)
imull	%edx, %eax	# eax = t2 * t5 (rval)

Another Example

```
int logical(int x, int y)
{
    int t1 = x^y;
    int t2 = t1 >> 17;
    int mask = (1<<13) - 7;
    int rval = t2 & mask;
    return rval;
}
```

logical:

```
    pushl %ebp
    movl %esp,%ebp
    movl 12(%ebp),%eax
    xorl 8(%ebp),%eax
    sarl $17,%eax
    andl $8185,%eax
    popl %ebp
    ret
```

} Set Up

} Body

} Finish

movl 12(%ebp),%eax	# eax = y
xorl 8(%ebp),%eax	# eax = x^y (t1)
sarl \$17,%eax	# eax = t1>>17 (t2)
andl \$8185,%eax	# eax = t2 & mask (rval)

Another Example

```
int logical(int x, int y)
{
    int t1 = x^y;
    int t2 = t1 >> 17;
    int mask = (1<<13) - 7;
    int rval = t2 & mask;
    return rval;
}
```

logical:

```
    pushl %ebp
    movl %esp,%ebp
    } Set Up

    movl 12(%ebp),%eax
    xorl 8(%ebp),%eax
    sarl $17,%eax
    andl $8185,%eax
    } Body

    popl %ebp
    ret
    } Finish
```

movl 12(%ebp),%eax	# eax = y
xorl 8(%ebp),%eax	# eax = x^y (t1)
sarl \$17,%eax	# eax = t1>>17 (t2)
andl \$8185,%eax	# eax = t2 & mask (rval)

Another Example

```
int logical(int x, int y)
{
    int t1 = x^y;
    int t2 = t1 >> 17;
    int mask = (1<<13) - 7;
    int rval = t2 & mask;
    return rval;
}
```

logical:

```
    pushl %ebp
    movl %esp,%ebp
    } Set Up

    movl 12(%ebp),%eax
    xorl 8(%ebp),%eax
    sarl $17,%eax
    andl $8185,%eax
    } Body

    popl %ebp
    ret
    } Finish
```

movl 12(%ebp),%eax	# eax = y
xorl 8(%ebp),%eax	# eax = x^y (t1)
sarl \$17,%eax	# eax = t1>>17 (t2)
andl \$8185,%eax	# eax = t2 & mask (rval)

Another Example

```
int logical(int x, int y)
{
    int t1 = x^y;
    int t2 = t1 >> 17;
    int mask = (1<<13) - 7;
    int rval = t2 & mask;
    return rval;
}
```

$$2^{13} = 8192, 2^{13} - 7 = 8185$$

logical:

```
    pushl %ebp
    movl %esp,%ebp
    } Set Up

    movl 12(%ebp),%eax
    xorl 8(%ebp),%eax
    sarl $17,%eax
    andl $8185,%eax
    } Body

    popl %ebp
    ret
    } Finish
```

<code>movl 12(%ebp),%eax</code>	<code># eax = y</code>
<code>xorl 8(%ebp),%eax</code>	<code># eax = x^y (t1)</code>
<code>sarl \$17,%eax</code>	<code># eax = t1>>17 (t2)</code>
<code>andl \$8185,%eax</code>	<code># eax = t2 & mask (rval)</code>

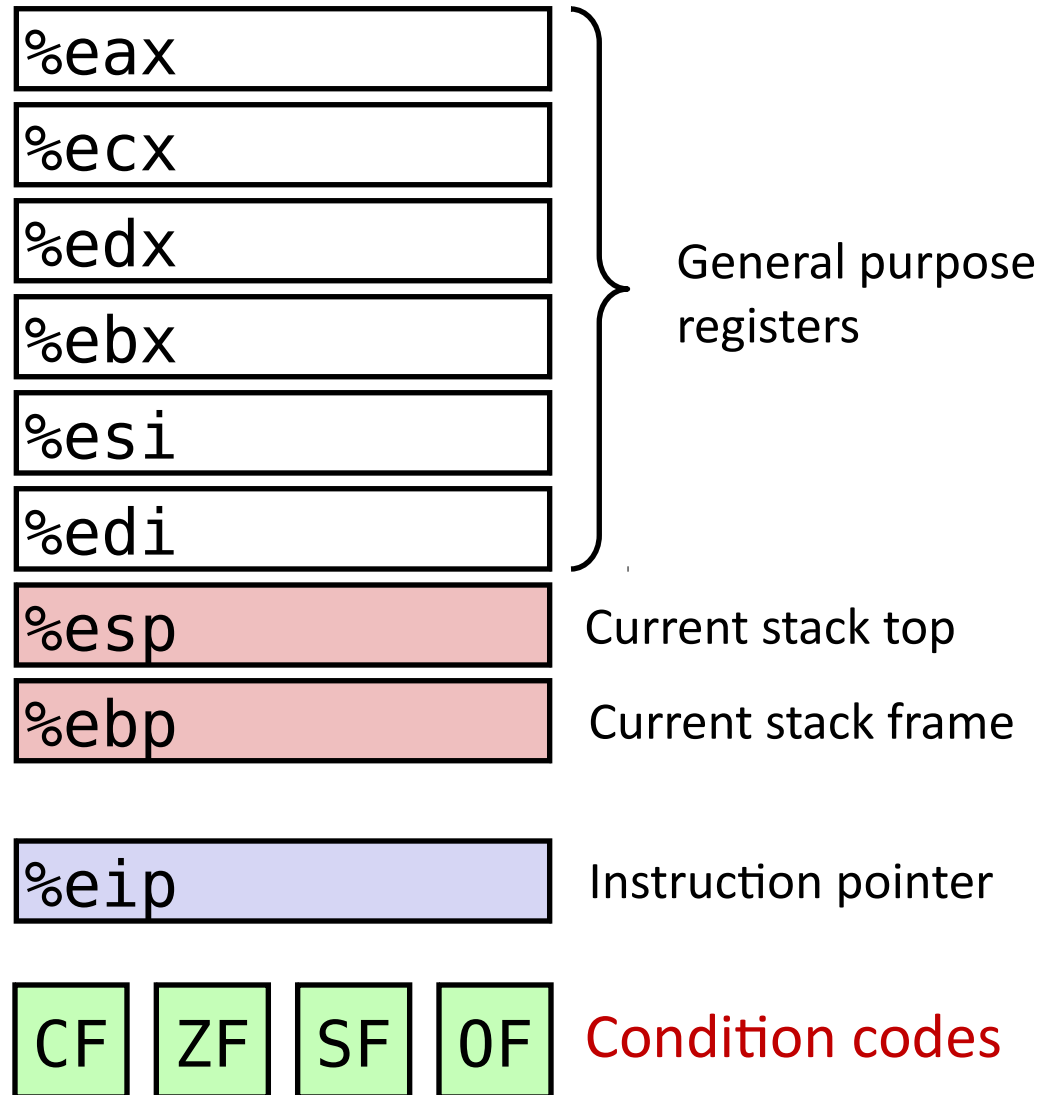

Today

- Complete addressing mode, address computation (leal)
- Arithmetic operations
- **Control: Condition codes**
- Conditional branches
- Loops

Processor State (IA32, Partial)

■ Information about currently executing program

- Temporary data (%eax, ...)
- Location of runtime stack (%ebp,%esp)
- Location of current code control point (%eip, ...)
- Status of recent tests (CF, ZF, SF, OF)

Condition Codes (Implicit Setting)

■ Single bit registers

- CF Carry Flag (for unsigned) SF Sign Flag (for signed)
- ZF Zero Flag OF Overflow Flag (for signed)

■ Implicitly set (think of it as side effect) by arithmetic operations

Example: `addl Src, Dest` \leftrightarrow `t = a+b`

CF set if carry out from most significant bit (unsigned overflow)

ZF set if `t == 0`

SF set if `t < 0` (as signed)

OF set if two's-complement (signed) overflow

`(a>0 && b>0 && t<0) || (a<0 && b<0 && t>=0)`

■ Not set by `leal` instruction

■ Full documentation (IA32), link on course website

Condition Codes (Explicit Setting: Compare)

■ Explicit Setting by Compare Instruction

- `Cmpl Src2, Src1`
- `cmpl b, a` like computing $a - b$ without setting destination
- **CF set** if carry out from most significant bit (used for unsigned comparisons)
- **ZF set** if $a == b$
- **SF set** if $(a - b) < 0$ (as signed)
- **OF set** if two's-complement (signed) overflow
 $(a > 0 \ \&\& \ b < 0 \ \&\& \ (a - b) < 0) \ || \ (a < 0 \ \&\& \ b > 0 \ \&\& \ (a - b) > 0)$

Condition Codes (Explicit Setting: Test)

■ Explicit Setting by Test instruction

- `Testl Src2, Src1`

`testl b, a` like computing `a&b` without setting destination

- Sets condition codes based on value of `Src1` & `Src2`

- Useful to have one of the operands be a mask

- **ZF set** when `a&b == 0`

- **SF set** when `a&b < 0`

Reading Condition Codes

■ SetX Instructions

- Set single byte based on combinations of condition codes

SetX	Condition	Description
sete	ZF	Equal / Zero
setne	\sim ZF	Not Equal / Not Zero
sets	SF	Negative
setns	\sim SF	Nonnegative
setg	\sim (SF \wedge OF)& \sim ZF	Greater (Signed)
setge	\sim (SF \wedge OF)	Greater or Equal (Signed)
setl	(SF \wedge OF)	Less (Signed)
setle	(SF \wedge OF) ZF	Less or Equal (Signed)
seta	\sim CF& \sim ZF	Above (unsigned)
setb	CF	Below (unsigned)

Use?

Reading Condition Codes (Cont.)

■ SetX Instructions:

- Set single byte based on combination of condition codes

■ One of 8 addressable byte registers

- Does not alter remaining 3 bytes
- Typically use `movzbl` to finish job

```
int gt (int x, int y)
{
    return x > y;
}
```

Body

```
movl 12(%ebp),%eax    # eax = y
cmpl %eax,8(%ebp)     # Compare x : y
setg %al              # al = x > y
movzbl %al,%eax       # Zero rest of %eax
```

%eax	%ah	%al
%ecx	%ch	%cl
%edx	%dh	%dl
%ebx	%bh	%bl
%esi		
%edi		
%esp		
%ebp		

Reading Condition Codes: x86-64

■ SetX Instructions:

- Set single byte based on combination of condition codes
- Does not alter remaining 3 bytes

```
int gt (long x, long y)
{
    return x > y;
}
```

```
long lgt (long x, long y)
{
    return x > y;
}
```

Bodies

```
cmpl %esi, %edi
setg %al
movzbl %al, %eax
```

```
cmpq %rsi, %rdi
setg %al
movzbl %al, %eax
```

Is %rax zero?

Yes: 32-bit instructions set high order 32 bits to 0!

Note: Let the compiler have fun for you.

Today

- Complete addressing mode, address computation (leal)
- Arithmetic operations
- x86-64
- Control: Condition codes
- **Conditional branches & Moves**
- Loops

Jumping

■ jX Instructions

- Jump to different part of code depending on condition codes

jX	Condition	Description
jmp	1	Unconditional
je	ZF	Equal / Zero
jne	\sim ZF	Not Equal / Not Zero
js	SF	Negative
jns	\sim SF	Nonnegative
jg	\sim (SF \wedge OF) $\&$ \sim ZF	Greater (Signed)
jge	\sim (SF \wedge OF)	Greater or Equal (Signed)
jl	(SF \wedge OF)	Less (Signed)
jle	(SF \wedge OF) ZF	Less or Equal (Signed)
ja	\sim CF $\&$ \sim ZF	Above (unsigned)
jb	CF	Below (unsigned)

Conditional Branch Example

```
int absdiff(int x, int y)
{
    int result;
    if (x > y) {
        result = x-y;
    } else {
        result = y-x;
    }
    return result;
}
```

```
absdiff:
    pushl    %ebp
    movl     %esp, %ebp
    movl     8(%ebp), %edx
    movl     12(%ebp), %eax
    cmpl     %eax, %edx
    jle      .L6
    subl     %eax, %edx
    movl     %edx, %eax
    jmp      .L7
.L6:
    subl     %edx, %eax
.L7:
    popl     %ebp
    ret
```

Diagram illustrating the assembly code structure with labels and groupings:

- Setup**:
 - pushl %ebp
 - movl %esp, %ebp
- Body1**:
 - movl 8(%ebp), %edx
 - movl 12(%ebp), %eax
 - cmpl %eax, %edx
- Body2a**:
 - jle .L6
 - subl %eax, %edx
 - movl %edx, %eax
- Body2b**:
 - jmp .L7
- Finish**:
 - .L6: subl %edx, %eax
 - .L7: popl %ebp
 - ret

Conditional Branch Example (Cont.)

```
int goto_ad(int x, int y)
{
    int result;
    if (x <= y) goto Else;
    result = x-y;
    goto Exit;
Else:
    result = y-x;
Exit:
    return result;
}
```

absdiff:

```
    pushl    %ebp
    movl     %esp, %ebp
    movl     8(%ebp), %edx
    movl     12(%ebp), %eax
    cmpl     %eax, %edx
    jle      .L6
    subl     %eax, %edx
    movl     %edx, %eax
    jmp      .L7
.L6:
    subl     %edx, %eax
.L7:
    popl     %ebp
    ret
```

Setup

Body1

Body2a

Body2b

Finish

- C allows “goto” as means of transferring control
 - Closer to machine-level programming style
- This is a very bad coding style – don’t use it in practice!

Conditional Branch Example (Cont.)

```
int goto_ad(int x, int y)
{
    int result;
    if (x <= y) goto Else;
    result = x-y;
    goto Exit;
Else:
    result = y-x;
Exit:
    return result;
}
```

```
absdiff:
    pushl    %ebp
    movl     %esp, %ebp
    movl     8(%ebp), %edx
    movl     12(%ebp), %eax
    cmpl     %eax, %edx
    jle      .L6
    subl     %eax, %edx
    movl     %edx, %eax
    jmp      .L7
.L6:
    subl     %edx, %eax
.L7:
    popl     %ebp
    ret
```

Setup

Body1

Body2a

Body2b

Finish

Conditional Branch Example (Cont.)

```
int goto_ad(int x, int y)
{
    int result;
    if (x <= y) goto Else;
    result = x-y;
    goto Exit;
Else:
    result = y-x;
Exit:
    return result;
}
```

```
absdiff:
    pushl    %ebp
    movl     %esp, %ebp
    movl     8(%ebp), %edx
    movl     12(%ebp), %eax
    cmpl     %eax, %edx
    jle      .L6
    subl     %eax, %edx
    movl     %edx, %eax
    jmp      .L7
.L6:
    subl     %edx, %eax
.L7:
    popl     %ebp
    ret
```

Setup

Body1

Body2a

Body2b

Finish

Conditional Branch Example (Cont.)

```
int goto_ad(int x, int y)
{
    int result;
    if (x <= y) goto Else;
    result = x-y;
    goto Exit;
Else:
    result = y-x;
Exit:
    return result;
}
```

```
absdiff:
    pushl    %ebp
    movl     %esp, %ebp
    movl     8(%ebp), %edx
    movl     12(%ebp), %eax
    cmpl     %eax, %edx
    jle      .L6
    subl     %eax, %edx
    movl     %edx, %eax
    jmp      .L7
.L6:
    subl     %edx, %eax
.L7:
    popl     %ebp
    ret
```

Setup

Body2b

Finish

General Conditional Expression Translation

C Code

```
val = Test ? Then_Expr : Else_Expr;
```

```
val = x > y ? x - y : y - x;
```

Goto Version

```
nt = !Test;  
if (nt) goto Else;  
val = Then_Expr;  
goto Done;  
Else:  
    val = Else_Expr;  
Done:  
    . . .
```

- Test is expression returning integer
 - = 0 interpreted as false
 - ≠ 0 interpreted as true
- Create separate code regions for then & else expressions
- Execute appropriate one

Using Conditional Moves

■ Conditional Move Instructions

- Instruction supports:
if (Test) Dest = Src
- Supported in post-1995 x86 processors
- GCC does not always use them
 - Wants to preserve compatibility with ancient processors
 - Enabled for x86-64
 - Use switch `-march=686` for IA32

■ Why?

- Branches are very disruptive to instruction flow through pipelines
- Conditional move do not require control transfer

C Code

```
val = Test  
    ? Then_Expr  
    : Else_Expr;
```

Goto Version

```
tval = Then_Expr;  
result = Else_Expr;  
t = Test;  
if (t) result = tval;  
return result;
```

Conditional Move Example: x86-64

```
int absdiff(int x, int y) {  
    int result;  
    if (x > y) {  
        result = x-y;  
    } else {  
        result = y-x;  
    }  
    return result;  
}
```

absdiff:

x in %edi

y in %esi

```
    movl    %edi, %edx  
    subl    %esi, %edx    # tval = x-y  
    movl    %esi, %eax  
    subl    %edi, %eax    # result = y-x  
    cmpl    %esi, %edi    # Compare x:y  
    cmovg    %edx, %eax    # If >, result = tval  
    ret
```

Aside: cmov

- **cmov is available under IA32, but not all generations.**
 - Compilers are conservative by default.
 - You can generate code with cmov with the right options.
- **In 64-bit mode: all CPUs supporting 64-bit support cmov as well!**

Bad Cases for Conditional Move – Compiler's Job

Expensive Computations

```
val = Test(x) ? Hard1(x) : Hard2(x);
```

- Both values get computed
- Only makes sense when computations are very simple

Risky Computations

```
val = p ? *p : 0;
```

- Both values get computed
- May have undesirable effects - **crash**

Computations with side effects

```
val = x > 0 ? x*=7 : x+=3;
```

- Both values get computed
- Must be side-effect free

Today

- Complete addressing mode, address computation (leal)
- Arithmetic operations
- x86-64
- Control: Condition codes
- Conditional branches and moves
- **Loops**

“Do-While” Loop Example

C Code

```
int pcount_do(unsigned x)
{
    int result = 0;
    do {
        result += x & 0x1;
        x >>= 1;
    } while (x);
    return result;
}
```

Goto Version

```
int pcount_do(unsigned x)
{
    int result = 0;
loop:
    result += x & 0x1;
    x >>= 1;
    if (x)
        goto loop;
    return result;
}
```

- Count number of 1's in argument x (“popcount”)
- Use conditional branch to either continue looping or to exit loop

“Do-While” Loop Compilation

Goto Version

```
int pcount_do(unsigned x) {  
    int result = 0;  
loop:  
    result += x & 0x1;  
    x >>= 1;  
    if (x)  
        goto loop;  
    return result;  
}
```

Registers:

```
%edx  x  
%ecx  result
```

```
movl    $0, %ecx        # result = 0  
.L2:  
movl    %edx, %eax  
andl    $1, %eax        # t = x & 1  
addl    %eax, %ecx      # result += t  
shrl    %edx            # x >>= 1  
jne     .L2             # If !0, goto loop
```

General “Do-While” Translation

C Code

```
do  
    Body  
while (Test) ;
```

Goto Version

```
loop:  
    Body  
    if (Test)  
        goto loop
```

■ **Body:** {
 Statement₁;
 Statement₂;
 ...
 Statement_n;
}

■ **Test returns integer**

- = 0 interpreted as false
- ≠ 0 interpreted as true

“While” Loop Example

C Code

```
int pcount_while(unsigned x) {  
    int result = 0;  
    while (x) {  
        result += x & 0x1;  
        x >>= 1;  
    }  
    return result;  
}
```

Goto Version

```
int pcount_do(unsigned x) {  
    int result = 0;  
    if (!x) goto done;  
loop:  
    result += x & 0x1;  
    x >>= 1;  
    if (x)  
        goto loop;  
done:  
    return result;  
}
```

General “While” Translation

While version

```
while (Test)  
  Body
```

Do-While Version

```
if (!Test)  
  goto done;  
do  
  Body  
  while (Test);  
done:
```

Goto Version

```
if (!Test)  
  goto done;  
loop:  
  Body  
  if (Test)  
    goto loop;  
done:
```

“For” Loop Example

C Code

```
#define WSIZE 8*sizeof(int)
int pcount_for(unsigned x) {
    int i;
    int result = 0;
    for (i = 0; i < WSIZE; i++) {
        unsigned mask = 1 << i;
        result += (x & mask) != 0;
    }
    return result;
}
```

- Is this code equivalent to other versions?

“For” Loop Form

General Form

```
for (Init; Test; Update )  
    Body
```

```
for (i = 0; i < WSIZE; i++) {  
    unsigned mask = 1 << i;  
    result += (x & mask) != 0;  
}
```

Init

```
i = 0
```

Test

```
i < WSIZE
```

Update

```
i++
```

Body

```
{  
    unsigned mask = 1 << i;  
    result += (x & mask) != 0;  
}
```

“For” Loop -> While Loop

For Version

```
for (Init; Test; Update )  
    Body
```

While Version

```
Init ;  
while (Test) {  
    Body  
    Update ;  
}
```

“For” Loop -> ... -> Goto

For Version

```
for (Init; Test; Update )  
    Body
```

While Version

```
Init;  
while (Test) {  
    Body  
    Update;  
}
```

```
Init;  
if (!Test)  
    goto done;  
do  
    Body  
    Update  
while (Test);  
done:
```

```
Init;  
if (!Test)  
    goto done;  
loop:  
    Body  
    Update  
    if (Test)  
        goto loop;  
done:
```

“For” Loop Conversion Example

Goto Version

C Code

```
#define WSIZE 8*sizeof(int)
int pcount_for(unsigned x) {
    int i;
    int result = 0;
    for (i = 0; i < WSIZE; i++) {
        unsigned mask = 1 << i;
        result += (x & mask) != 0;
    }
    return result;
}
```

- Initial test can be optimized away

```
int pcount_for_gt(unsigned x) {
    int i;
    int result = 0;
    i = 0;
    if (!(i < WSIZE))
    goto done;
loop:
    {
        unsigned mask = 1 << i;
        result += (x & mask) != 0;
    }
    i++;
    if (i < WSIZE)
        goto loop;
done:
    return result;
}
```

Summary

■ Today

- Complete addressing mode, address computation (leal)
- Arithmetic operations
- Control: Condition codes
- Conditional branches & conditional moves
- Loops

■ Next Time

- Switch statements
- Stack
- Call / return
- Procedure call discipline

Lessons

■ Specific to x86

- Addressing modes
- Operands and order

■ General concepts

- Different addressing modes
- State flags
- Arithmetic instructions modify state flags
- Special test/cmp instructions modify state flags
- Conditional/unconditional jumps
- Pattern to transform high-level constructs into low-level instructions
